Practical 1:

A. Write a program for obtaining descriptive statistics of data.

```
########################################################################
#Practical    1A:    Write a python program on descriptive statistics analysis.
########################################################################
import pandas as pd
#Create a Dictionary of series
d = {'Age':pd.Series([25,26,25,23,30,29,23,34,40,30,51,46]),
'Rating':pd.Series([4.23,3.24,3.98,2.56,3.20,4.6,3.8,3.78,2.98,4.80,4.10,3.65])}
#Create a DataFrame
df = pd.DataFrame(d)
print(df)
print('############  Sum ########## ')
print (df.sum())
print('############  Mean ########## ')
print (df.mean())
print('############  Standard Deviation ########## ')
print (df.std())
print('############  Descriptive Statistics ########## ')
print (df.describe())
```

Output:

```
    Age  Rating
0    25    4.23
1    26    3.24
2    25    3.98
3    23    2.56
4    30    3.20
5    29    4.60
6    23    3.80
7    34    3.78
8    40    2.98
9    30    4.80
10   51    4.10
11   46    3.65
############  Sum ##########
Age       382.00
Rating     44.92
dtype: float64
############  Mean ##########
Age       31.833333
Rating     3.743333
dtype: float64
############  Standard Deviation ##########
Age       9.232682
Rating    0.661628
dtype: float64
############  Descriptive Statistics ##########
             Age     Rating
count  12.000000  12.000000
mean   31.833333   3.743333
std     9.232682   0.661628

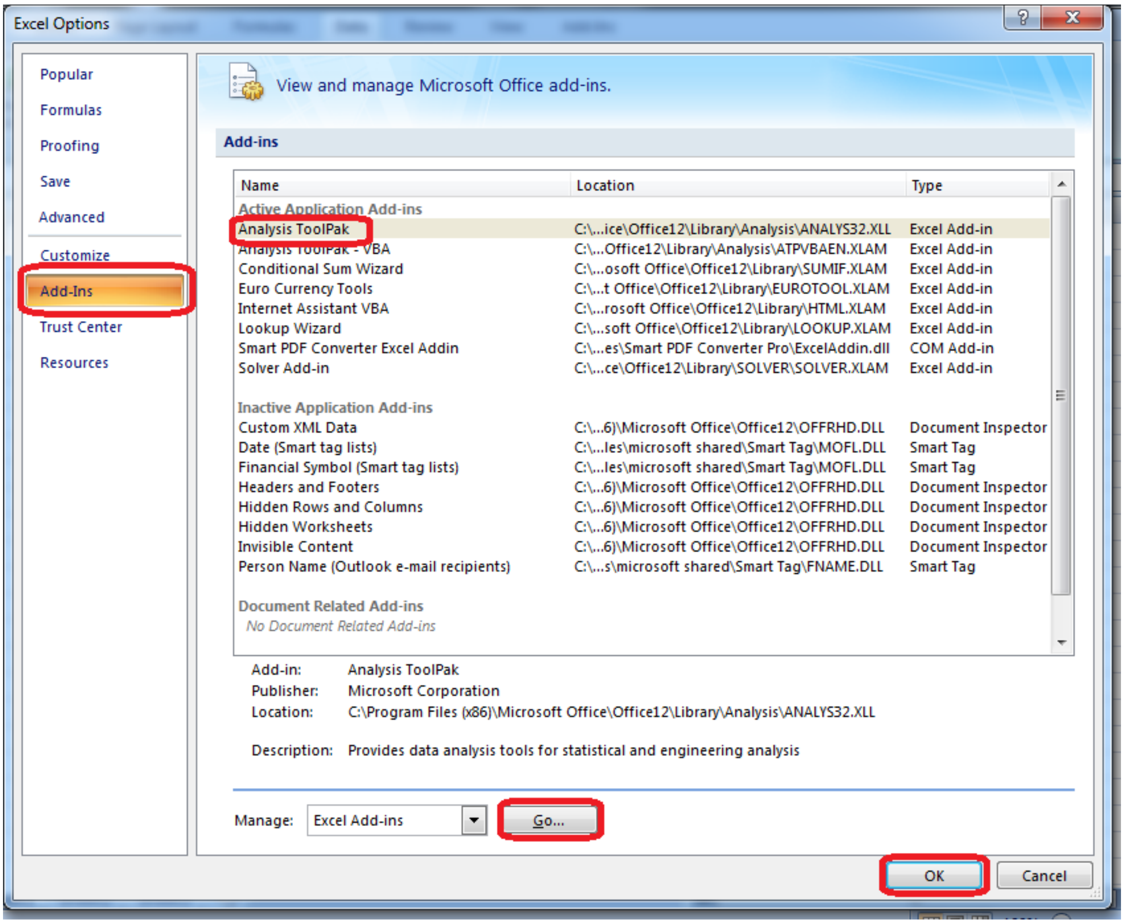
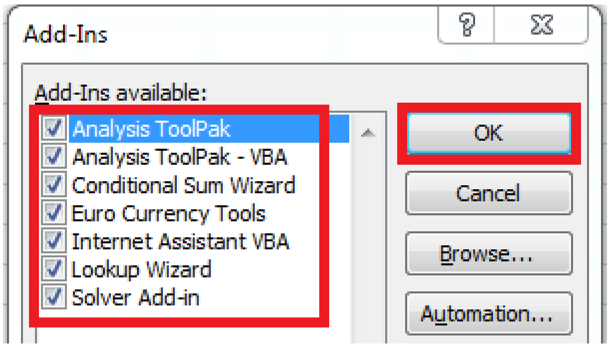
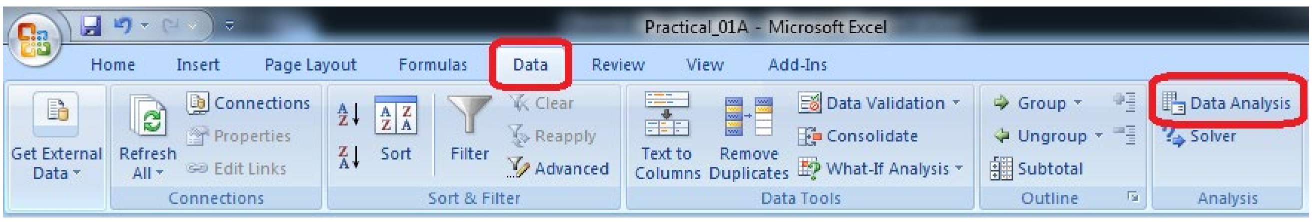
75%    35.500000   4.132500
max    51.000000   4.800000
```

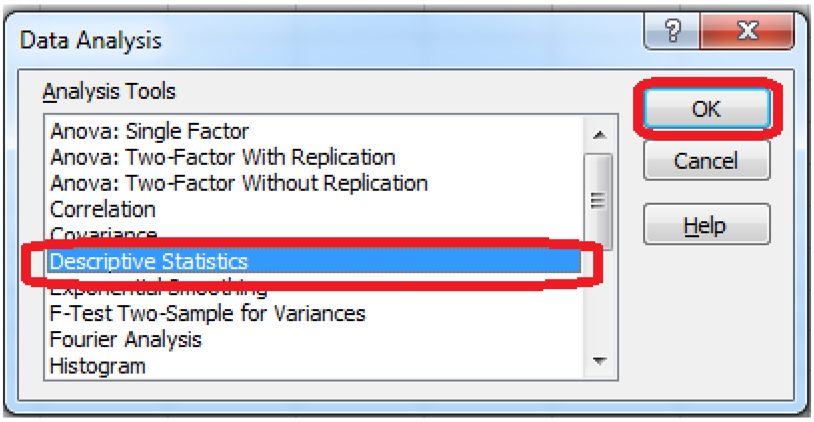
Using Excel

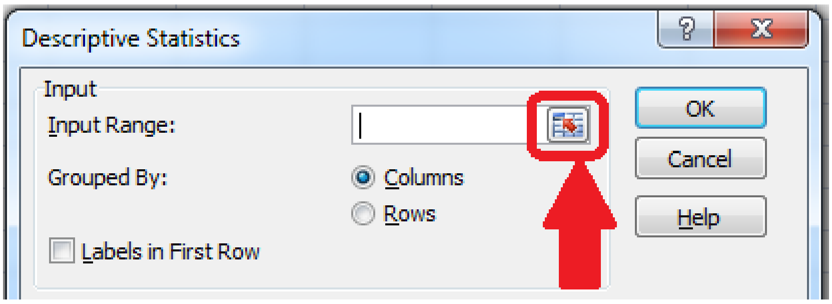
Go to File Menu → Options → Add-Ins→ Select Analysis ToolPak→ Press OK





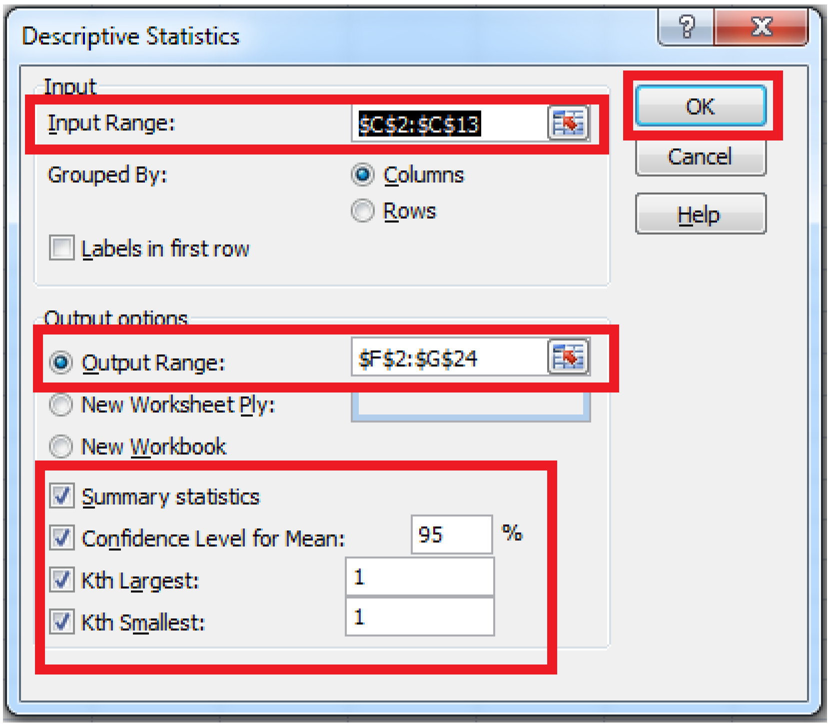






Select the data range from the excel worksheet.

	A	B	C	D	E	F	G
1	Sr. No	Name	Age	Rating			
2	1	AA	25	4.23			
3	2	BB	26	3.24			
4	3	CC	25	3.98			
5	4	DD	23	2.56			
6	5	EE	30	3.2			
7	6	FF	29	4.6			
8	7	GG	23	3.8			
9	8	HH	34	3.78			
10	9	II	40	2.98			
11	10	JJ	30	4.8			
12	11	KK	51	4.1			
13	12	LL	46	3.65			
14							
15							
16							
17							



Output:

	A	B	C	D	E	F	G
1	Sr. No	Name	Age	Rating			
2	1	AA	25	4.23		*Column1*	
3	2	BB	26	3.24			
4	3	CC	25	3.98		Mean	31.83333
5	4	DD	23	2.56		Standard Error	2.665246
6	5	EE	30	3.2		Median	29.5
7	6	FF	29	4.6		Mode	25
8	7	GG	23	3.8		Standard Deviation	9.232682
9	8	HH	34	3.78		Sample Variance	85.24242
10	9	II	40	2.98		Kurtosis	0.24931
11	10	JJ	30	4.8		Skewness	1.135089
12	11	KK	51	4.1		Range	28
13	12	LL	46	3.65		Minimum	23

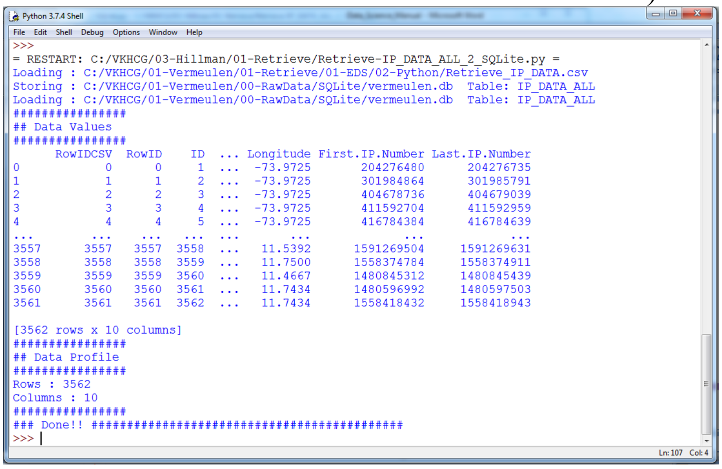
17						Largest(1)	51
18						Smallest(1)	23
19						Confidence Level(95.0%)	5.866167

B. Import data from different data sources (from Excel, csv, mysql, sql server, oracle to R/Python/Excel)

SQLite:

```
############################################## ##########################
# -*- coding: utf-8 -*-
############################################################################
import sqlite3 as sq
import pandas as pd
############################################################################
Base='C:/VKHCG'
sDatabaseName=Base + '/01-Vermeulen/00-RawData/SQLite/vermeulen.db'
conn = sq.connect(sDatabaseName)
############################################################################
sFileName='C:/VKHCG/01-Vermeulen/01-Retrieve/01-EDS/02-Python/Retrieve_IP_DATA.csv'
print('Loading :',sFileName)
IP_DATA_ALL_FIX=pd.read_csv(sFileName,header=0,low_memory=False)
IP_DATA_ALL_FIX.index.names = ['RowIDCSV']
sTable='IP_DATA_ALL'
print('Storing :',sDatabaseName,' Table:',sTable)
IP_DATA_ALL_FIX.to_sql(sTable, conn, if_exists="replace")
print('Loading :',sDatabaseName,' Table:',sTable)
TestData=pd.read_sql_query("select * from IP_DATA_ALL;", conn)
print('################')
print('## Data Values')
print('################')
print(TestData)
print('################')
print('## Data Profile')
print('################')
print('Rows :',TestData.shape[0])
print('Columns :',TestData.shape[1])
print('################')
print('### Done!! ############################################')
```



```
Python 3.7.4 Shell
File Edit Shell Debug Options Window Help

Practical 2:

A. Design a survey form for a given case study, collect the primary data and analyse it

Case 1:

A researcher wants to conduct a Survey in colleges on Use of ICT in higher education from Mumbai, Thane and Navi Mumbai. The survey focuses on access to and use of ICT in teaching and learning, as well as on attitudes towards the use of ICT in teaching and learning.

Design questionnaire addressed to teachers seeks information about the target class, his experience using ICT for teaching, access to ICT infrastructure, support available, ICT based activities and material used, obstacles to the use of ICT in teaching, learning activities with the target class, your skills and attitudes to ICT, and some personal background information.

Arrange question in following groups:

1. Information about the target class you teach
2. Experience with ICT for teaching
3. ICT access for teaching
4. Support to teachers for ICT use
5. ICT based activities and material used for teaching
6. Obstacles to using ICT in teaching and learning
7. Learning activities with the target class
8. Teacher skills
9. Teacher opinions and attitudes
10. Personal background information

Case 2:

A research agency wants to study the perception about App based taxi service in Mumbai, Thane and Navi Mumbai. The survey focuses on customers attitude towards app base taxi service as well as on attitudes towards regular taxi cab.

Design questionnaire seeks information about the target taxi service, his experience using taxi services, access, support available, obstacles and some personal background information, with the following objectives:

1. To find out the customer satisfaction towards the App based-taxi services.
2. To find the level of convenience and comfort with App based -taxi services.
3. To know their opinion about the tariff system and promptness of service.

4. To ascertain the customer view towards the driver behaviour and courtesy.
5. To provide inputs to enhance the services to delight the customers.
6. To examine relationship between service quality factors and taxi passenger satisfaction.
7. To suggest better regulations for transportation authorities regarding customer protection and effective monitoring of taxi services.

Case 3:

A popular electronic store want to conduct a survey to develop awareness of branded laptop baseline estimates and determine popularity of different company's laptop. It suggests steps to be initiated or strengthened in the field of demand in a region. The key indicators are among the general population, demand branded laptop and the problem users.

The objectives of this particular study are:-

1. To know the preferences of different types of branded laptops by students and professionals.
2. To study which factor influence for choosing different types of branded laptops.
3. To know about the level of satisfaction towards different types of branded laptops.
4. To identify the perception of consumers towards the laptop positioning strategy.
5. To know the consumer preference towards laptop in the present era.

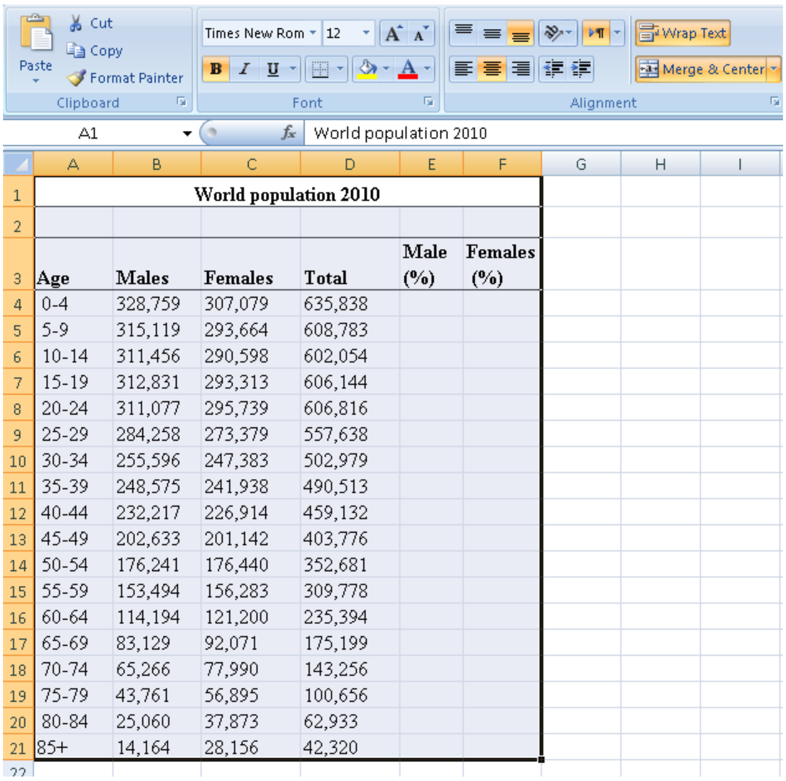
Use the collected data for analysis.

B. Perform analysis of given secondary data.

Steps in Secondary Data Analysis

1. **Determine your research question** – Knowing exactly what you are looking for.
2. **Locating data**– Knowing what is out there and whether you can gain access to it. A quick Internet search, possibly with the help of a librarian, will reveal a wealth of options.
3. **Evaluating relevance of the data** – Considering things like the data's original purpose, when it was collected, population, sampling strategy/sample, data collection protocols, operationalization of concepts, questions asked, and form/shape of the data.
4. **Assessing credibility of the data** – Establishing the credentials of the original researchers, searching for full explication of methods including any problems encountered, determining how consistent the data is with data from other sources, and discovering whether the data has been used in any credible published research.
5. **Analysis –** This will generally involve a range of statistical processes.

Example: Analyze the given Population Census Data for Planning and Decision Making by using the size and composition of populations.

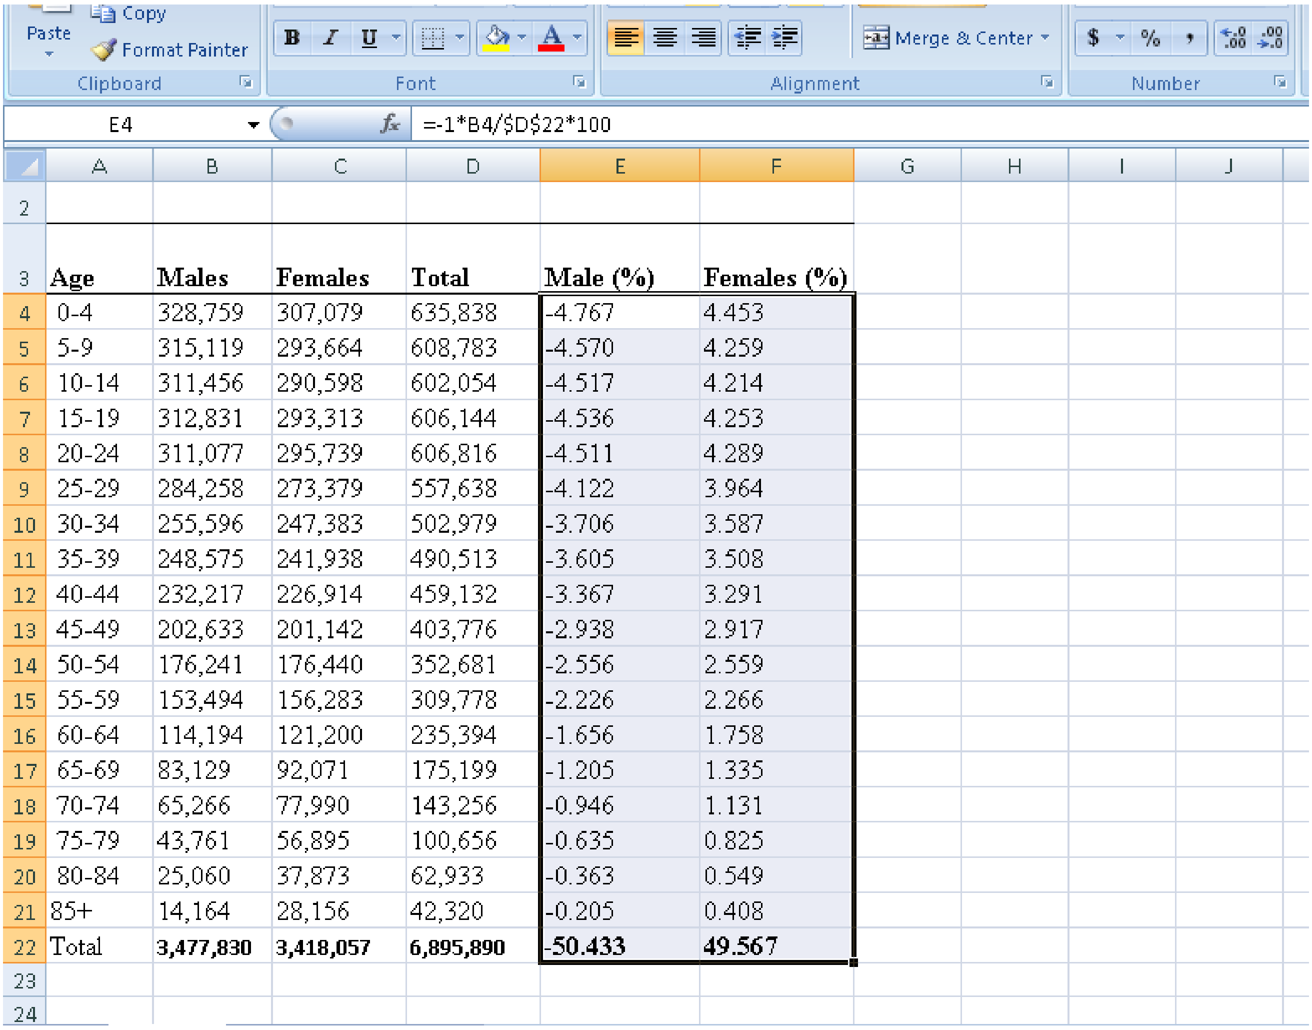


World population 2010					
Age	Males	Females	Total	Male (%)	Females (%)
0-4	328,759	307,079	635,838		
5-9	315,119	293,664	608,783		
10-14	311,456	290,598	602,054		
15-19	312,831	293,313	606,144		
20-24	311,077	295,739	606,816		
25-29	284,258	273,379	557,638		
30-34	255,596	247,383	502,979		
35-39	248,575	241,938	490,513		
40-44	232,217	226,914	459,132		
45-49	202,633	201,142	403,776		
50-54	176,241	176,440	352,681		
55-59	153,494	156,283	309,778		
60-64	114,194	121,200	235,394		
65-69	83,129	92,071	175,199		
70-74	65,266	77,990	143,256		
75-79	43,761	56,895	100,656		
80-84	25,060	37,873	62,933		
85+	14,164	28,156	42,320		

Put the cursor in cell **B22** and click on the **AutoSum** and then click **Enter**. This will calculate the total population. Then copy the formula in cell **D22** across the row **22.**

To calculate the percent of males in cell **E4**, enter the formula **=-1*100*B4/$D$22** . And copy the formula in cell **E4** down to cell **E21.**

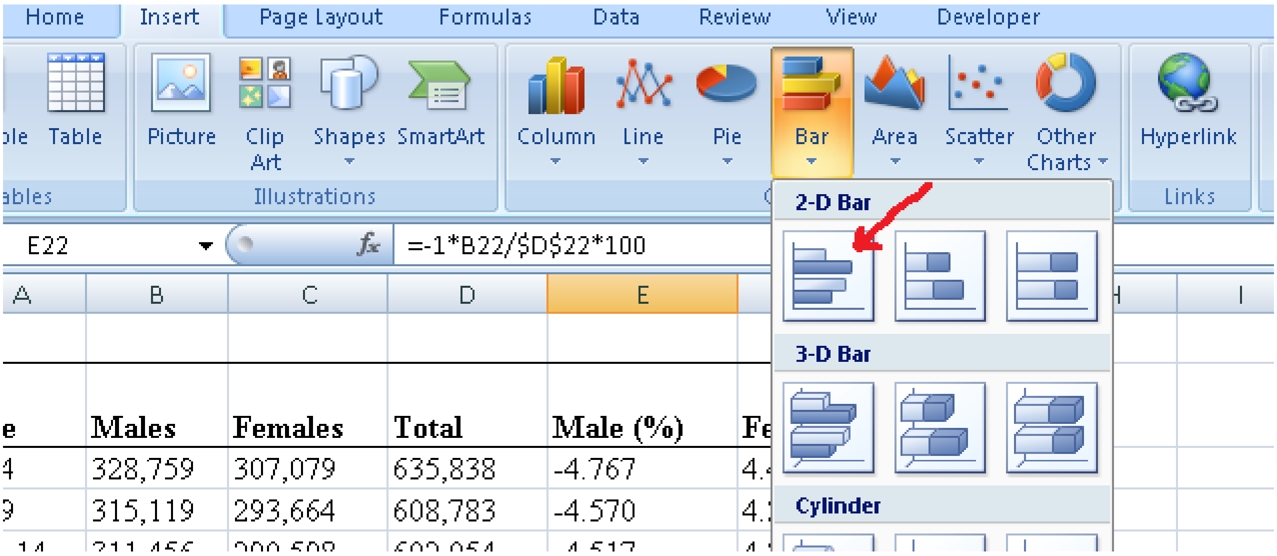
To calculate the percent of females in cell **F4**, enter the formula =**100*C4/$D$22**. Copy the formula in cell **F4** down to cell **F21.**



Age	Males	Females	Total	Male (%)	Females (%)
0-4	328,759	307,079	635,838	-4.767	4.453
5-9	315,119	293,664	608,783	-4.570	4.259
10-14	311,456	290,598	602,054	-4.517	4.214
15-19	312,831	293,313	606,144	-4.536	4.253
20-24	311,077	295,739	606,816	-4.511	4.289
25-29	284,258	273,379	557,638	-4.122	3.964
30-34	255,596	247,383	502,979	-3.706	3.587
35-39	248,575	241,938	490,513	-3.605	3.508
40-44	232,217	226,914	459,132	-3.367	3.291
45-49	202,633	201,142	403,776	-2.938	2.917
50-54	176,241	176,440	352,681	-2.556	2.559
55-59	153,494	156,283	309,778	-2.226	2.266
60-64	114,194	121,200	235,394	-1.656	1.758
65-69	83,129	92,071	175,199	-1.205	1.335
70-74	65,266	77,990	143,256	-0.946	1.131
75-79	43,761	56,895	100,656	-0.635	0.825
80-84	25,060	37,873	62,933	-0.363	0.549
85+	14,164	28,156	42,320	-0.205	0.408
Total	**3,477,830**	**3,418,057**	**6,895,890**	**-50.433**	**49.567**

To build the population pyramid, we need to choose a horizontal bar chart with two series of data (% male and % female) and the age labels in column A as the **Category X-axis** labels. Highlight the range **A3:A21**, hold down the CTRL key and highlight the range **E3:F21**

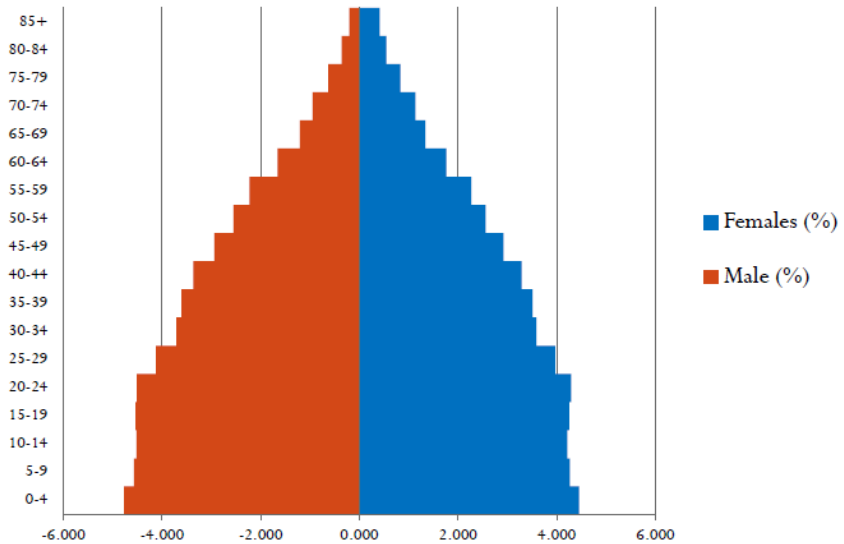
Under **inset** tab, under horizontal bar charts select **clustered bar chart**



Put the tip of your mouse arrow on the **Y-axis** (vertical axis) so it says "Category Axis", right click and chose **Format Axis**

Choose **Axis options** tab and set the major and minor tick mark type to **None**, Axis labels to **Low**, and click **OK**.

Click on any of the bars in your pyramid, click right and select "format data series". Set the **Overlap** to **100** and **Gap Width** to **0**. Click **OK**.



Practical 3:

A. Perform testing of hypothesis using one sample t-test.

One sample t-test : The One Sample *t* Test determines whether the sample mean is statistically different from a known or hypothesised population mean. The One Sample *t* Test is a parametric test.

Program Code:

```
# -*- coding: utf-8 -*-
"""
Created on Mon Dec 16 18:01:46 2019
@author: Ahtesham Shaikh
"""
fromscipy.stats import ttest_1samp
importnumpy as np
ages = np.genfromtxt('ages.csv')
print(ages)
ages_mean = np.mean(ages)
print(ages_mean)
tset, pval = ttest_1samp(ages, 30)
print('p-values - ',pval)

if pval< 0.05:    # alpha value is 0.05
    print(" we are rejecting null hypothesis")
else:
    print("we are accepting null hypothesis")
```

Output:

```

```

B. Write a program for t-test comparing two means for independent samples.

The *t* distribution provides a good way to perform one sample tests on the mean when the population variance is not known provided the population is normal or the sample is sufficiently large so that the Central Limit Theorem applies.

Two Sample t Test

Example: A college Princiapal informed classroom teachers that some of their students showedunusual potential for intellectual gains. One months later the students identified to teachers ashaving potentional for unusual intellectual gains showed significiantly greater gains performanceon a test said to measure IQ than did students who were not so identified. Below are the data forthe students:

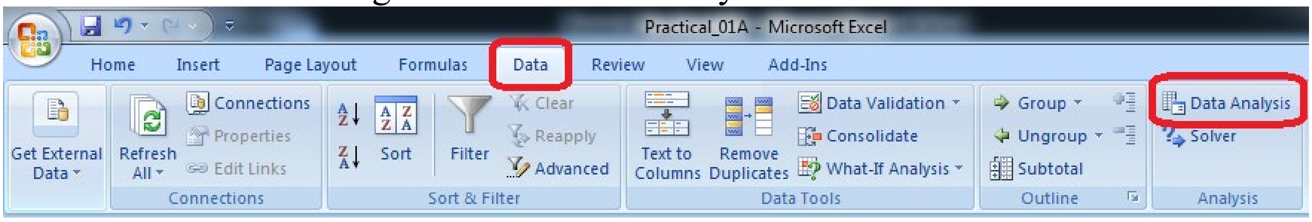
Experimental	Comparison	
35	2	
40	27	
12	38	
15	31	
21	1	
14	19	
46	1	
10	34	
28	3	
48	1	
16	2	
30	3	
32	2	
48	1	
31	2	
22	1	
12	3	
39	29	
19	37	
25	2	
27.15	11.95	Mean
12.51	14.61	Sd

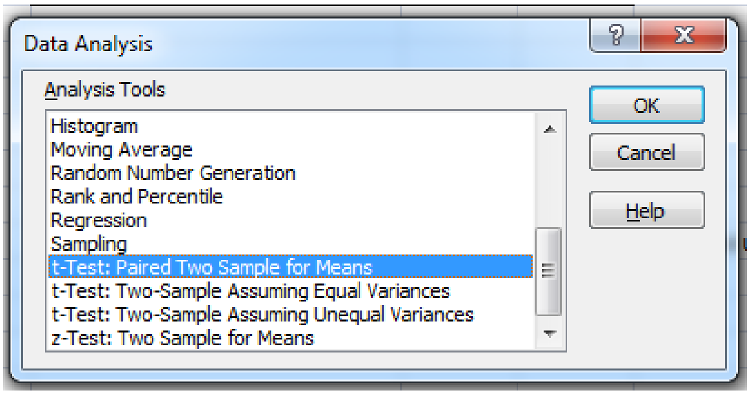
Experimental Data
To calculate Standard Mean go to cell A22 and type =SUM(A2:A21)/20
To calculate Standard Deviation go to cell A23 and type =STDEV(A2:A21)

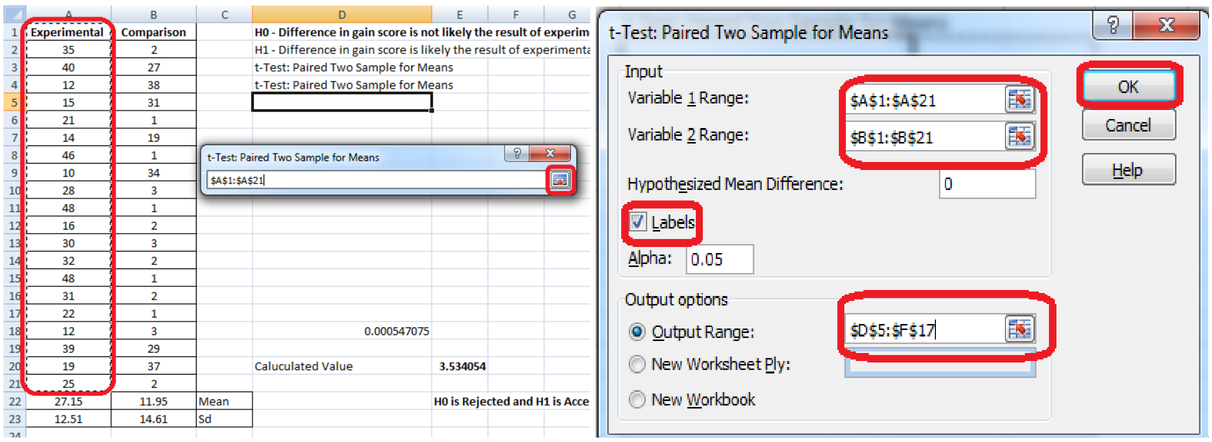
Comparison Data
To calculate Standard Mean go to cell B22 and type =SUM(B2:B21)/20

To calculate Standard Deviation go to cell B23 and type =STDEV(B2:B21)

To find T-Test Statistics go to data →Data Analysis







To caluculate the T-Test square value go to cell E20 and type
=(A22-B22)/SQRT((A23*A23)/COUNT(A2:A21)+(B23*B23)/COUNT(A2:A21))

Now go to cell E20 and type
=IF(E20<E12,"H0 is Accepted", "H0 is Rejected and H1 is Accepted")

Our calculated value is larger than the tabled value at alpha = .01, so we reject the null hypothesisand accept the alternative hypothesis, namely, that the difference in gain scores is likely the resultof the experimental treatment and not the result of chance variation.

Output:

	A	B	C	D	E	F	G	H	I	J	K
1	**Experimental**	**Comparison**		**H0 - Difference in gain score is not likely the result of experimental treatment.**							
2	35	2		H1 - Difference in gain score is likely the result of experimental treatment and not the result of change variation.							
3	40	27		t-Test: Paired Two Sample for Means							
4	12	38		t-Test: Paired Two Sample for Means							
5	15	31		t-Test: Paired Two Sample for Means							
6	21	1

23	12.51	14.61	Sd								

Using Python

```
importnumpy as np
fromscipy import stats
fromnumpy.random import randn
N = 20
#a = [35,40,12,15,21,14,46,10,28,48,16,30, 32,48,31,22,12,39,19,25]
#b = [2,27,31,38,1,19,1,34,3,1,2,1,3,1,2,1,3,29,37,2]
a = 5 * randn(100) + 50
b = 5 * randn(100) + 51
var_a = a.var(ddof=1)
var_b = b.var(ddof=1)

s = np.sqrt((var_a + var_b)/2)
t = (a.mean() - b.mean())/(s*np.sqrt(2/N))

df = 2*N - 2
#p-value after comparison with the t
p = 1 - stats.t.cdf(t,df=df)

print("t = " + str(t))
print("p = " + str(2*p))
if  t> p :
print('Mean of two distribution are differnt and significant')
else:
print('Mean of two distribution are same and not significant')
```

Output:

```
In [9]: runfile('E:/Research In Computing/Programs/
Practical_04/Program_4B.py', wdir='E:/Research In
Computing/Programs/Practical_04')
t = -1.051463820987354
p = 1.700313560478936
Mean of two distribution are same and not significant

In [10]: runfile('E:/Research In Computing/Programs/
Practical_04/Program_4B.py', wdir='E:/Research In
Computing/Programs/Practical_04')
t = 0.46409515960993775
p = 0.6452274090296801
Mean of two distribution are differnt and significant
```

Practice Questions:

Example 1: we have to test whether the height of men in the population is different from height of women in general. So we take a sample from the population and use the t-test to see if the result is significant.

H0 – Height of men and women are same

H1 – Height of men and women are the different

Men	Women
181	160
169	150
160	160
170	175
175	160
158	170
152	160
172	150
160	155
175	162
180	165
170	148
165	159
180	163
155	170
159	178
163	180
171	156
182	164
150	167

Example 2: Design a survey form to get grade of students who have passed B. Sc. IT and B. Sc. CS from the same University. Perform T-Test to test the given hypothsis:
H0 – Scores of students in two courses are same.
H1 – Scores of students are the different.

Example 2: Collect a sample data know that use of Online Food Ordering app to compare whether the usage is equal or different.

C. Perform testing of hypothesis using paired t-test.

The paired sample t-test is also called dependent sample t-test. It's an univariate test that tests for a significant difference between 2 related variables. An example of this is if you where to collect the blood pressure for an individual before and after some treatment, condition, or time point. The data set contains blood pressure readings before and after an intervention. These are variables "bp_before" and "bp_after".

The hypothesis being test is:

- **H_0** - The mean difference between sample 1 and sample 2 is equal to 0.
- **H_0** - The mean difference between sample 1 and sample 2 is not equal to 0

Program Code:

```
# -*- coding: utf-8 -*-
"""
Created on Mon Dec 16 19:49:23 2019

@author: MyHome
"""

from scipy import stats
import matplotlib.pyplot as plt

import pandas as pd

df = pd.read_csv("blood_pressure.csv")

print(df[['bp_before','bp_after']].describe())

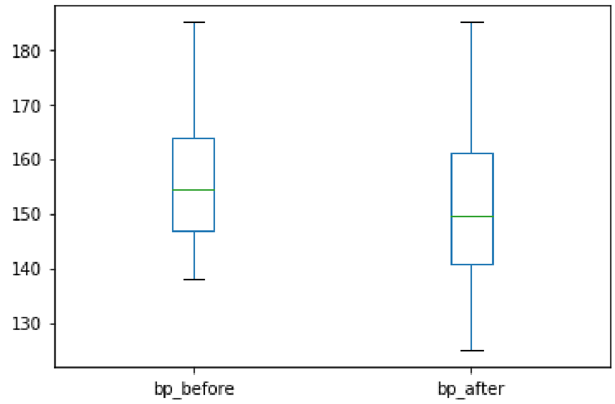
#First let's check for any significant outliers in
#each of the variables.
df[['bp_before', 'bp_after']].plot(kind='box')
# This saves the plot as a png file
plt.savefig('boxplot_outliers.png')

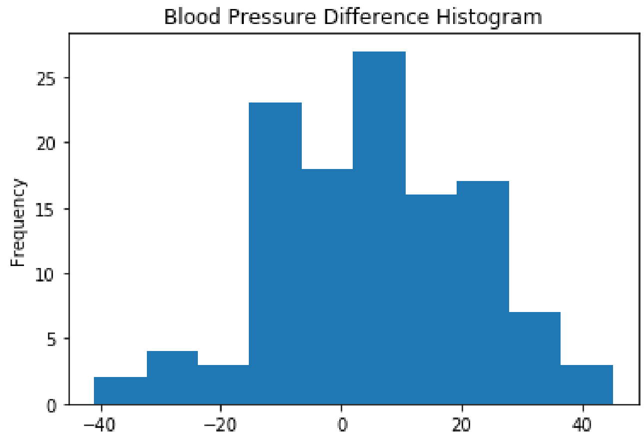
# make a histogram to differences between the two scores.
df['bp_difference'] = df['bp_before'] - df['bp_after']

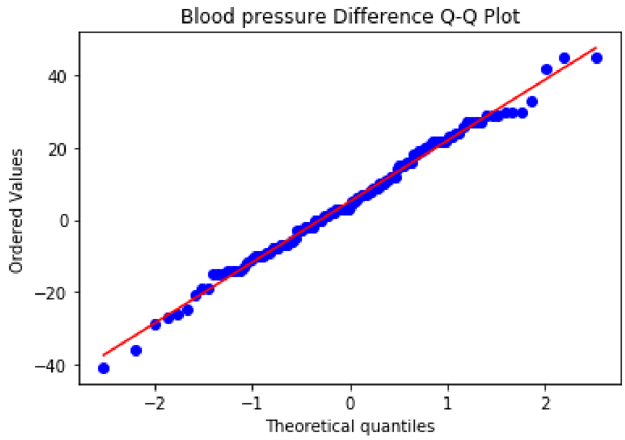
df['bp_difference'].plot(kind='hist', title= 'Blood Pressure Difference Histogram')
#Again, this saves the plot as a png file
```

```
plt.savefig('blood pressure difference histogram.png')
stats.probplot(df['bp_difference'], plot= plt)
plt.title('Blood pressure Difference Q-Q Plot')
plt.savefig('blood pressure difference qq plot.png')
stats.shapiro(df['bp_difference'])
stats.ttest_rel(df['bp_before'], df['bp_after'])
```

Output:







```

reject null hypothesis
```

A paired sample t-test was used to analyze the blood pressure before and after the intervention to test if the intervention had a significant affect on the blood pressure. The blood pressure before the intervention was higher (156.45 ± 11.39 units) compared to the blood pressure post intervention (151.36 ± 14.18 units); there was a statistically significant decrease in blood pressure ($t(119)=3.34$, $p= 0.0011$) of 5.09 units.

Practical 4:

A. Perform testing of hypothesis using chi-squared goodness-of-fit test.

Problem

Ansystem administrator needs to upgrade the computers for his division. He wants to know what sort of computer system his workers prefer. He gives three choices: Windows, Mac, or Linux. Test the hypothesis or theory that an equal percentage of the population prefers each type of computer system .

System	O	Ei	$\sum \frac{(O_i - E_i)^2}{Ei}$
Windows	20	33.33%	
Mac	60	33.33%	
Linux	20	33.33%	

H0 : The population distribution of the variable is the same as the proposed distribution
HA : The distributions are different

To calculate the Chi –Squred value for Windows go to cell D2 and type =((B2-C2)*(B2-C2))/C2

To calculate the Chi –Squred value for Mac go to cell D3 and type =((B3-C3)*(B3-C3))/C3

To calculate the Chi –Squred value for Mac go to cell D3 and type =((B4-C4)*(B4-C4))/C4

Go to Cell D5 for $\sum \frac{(O_i - E_i)^2}{Ei}$ and type=SUM(D2:D4)

To get the table value for Chi-Square for α = 0.05 and dof = 2, go to cell D7 and type =CHIINV(0.05,2)

At cell D8 type =IF(D5>D7, "H0 Accepted","H0 Rejected")

Output:

	A	B	C	D	E	F	G	H	I	J	K	L	M	N
1	System	O	Ei	$\sum \frac{(O_i - E_i)^2}{Ei}$										
2	Windows	20	33.33	5.333333		H0 : The population distribution of the variable is the same as the proposed distribution								
3	Mac	60	33.33	21.33333		H1 - : The distributions are different								
4	Linux	20	33.33	5.333333										
5	Total	100	100	32										
6														
7			Table Value	5.991465										
8			H0 Accepted											

Practice Questions:

1. The Mobile Association of Mumbai conducted a survey in 2019 and determined that 60% of users have only one SIM card, 28% have two SIM cards and 12% have three or more. Supposing that you have decided to conduct yourown survey and have collected the data that out of 129 Mobile Users, 73 had one SIM and 38 had two SIM, determine whether your data supports the results of the association's study.**(Use a significance level of 0.05.)**
2. In a debate, Geeta told Pankaj that the reason her car insurance is less expensive is that metro city drivers get in more accidents thanRuralarea drivers. According to her study,in metro cities drivers are held responsible in 65% of accidents. If Pankaj does some research of his own and discovers that 46 out of the 85 accidents he investigates involve rural areadrivers, does his data support or refute Geeta's hypothesis?

   Ho –Metro citiesdrivers are more responsible for accidents than rural area drivers are.

	O	Ei	$\sum\frac{(O_i - E_i)^2}{Ei}$
Rural Drivers	46	**65%**	
Metro Drivers	39	**35%**	
Total	85	**100**	

B. Perform testing of hypothesis using chi-squared test of independence.

In a study to understatnd the permormacne of M. Sc. IT Part -1 class, a college selects a random sample of 100 students. Each student was asked his grade obtained in B. Sc. IT. The sample is as given below

Sr. No	Roll No	Student's Name	Gen	Grade
1	1	Gaborone	m	O
2	2	Francistown	m	O
3	5	Niamey	m	O

Practice Questions

1. Anita claims that girls take more normal and filter appliedselfies than boys, but Karan does not agree with her, so he conducts a survey collects the following data, would it be correct to say that he should reject Anita's claim that gender affects tendency to take selfies?

   H0 - Gender affects tendency to take more photographs

	Normal Selfie	**Apply Filter**	**Total**
Female	72	489	561
Male	48	530	578
TOTAL	120	1019	1139

2. Ketan claims that single people prefer different pizzas than married people do. Kato's brother Anand doesn't think that is true, so he conducts some research of his own, and collects the data below.

	Pepperoni	Sausage	Cheese	TOTAL
Single	29	12	61	102
Married	8	47	56	111
TOTAL	37	59	117	213

   H0: Marital status and pizza type are not associated.

   H1: Marital type and pizza type are associated.

Practical 5:

Perform testing of hypothesis using Z-test.

Use a Z test if:

- Your sample size is greater than 30. Otherwise, use a t test.
- Data points should be independent from each other. In other words, one data point isn't related or doesn't affect another data point.
- Your data should be normally distributed. However, for large sample sizes (over 30) this doesn't always matter.
- Your data should be randomly selected from a population, where each item has an equal chance of being selected.
- Sample sizes should be equal if at all possible.

Ho - Blood pressure has a mean of 156 units

Program Code for one-sample Z test.

```
from statsmodels.stats import weightstats as stests
import pandas as pd
from scipy import stats
df = pd.read_csv("blood_pressure.csv")
df[['bp_before','bp_after']].describe()
print(df)
ztest ,pval = stests.ztest(df['bp_before'], x2=None, value=156)
print(float(pval))

if pval<0.05:
   print("reject null hypothesis")
else:
   print("accept null hypothesis")
```

Output:

```
In [26]: runfile('K:/Research In Computing/Practical
Material/Programs/Practical_05/Z_Test_One_Sample.py',
wdir='K:/Research In Computing/Practical Material/Programs/
Practical_05')

reject null hypothesis
```

Practical 6:

A.Perform testing of hypothesis using One-way ANOVA.

ANOVA Assumptions

- The dependent variable (SAT scores in our example) should be continuous.
- The independent variables (districts in our example) should be two or more categorical groups.
- There must be different participants in each group with no participant being in more than one group. In our case, each school cannot be in more than one district.
- The dependent variable should be approximately normally distributed for each category.
- Variances of each group are approximately equal.

From our data exploration, we can see that the average SAT scores are quite different for each district. Since we have five different groups, we cannot use the t-test, use the 1-way ANOVA test anyway just to understand the concepts.

H0 - There are no significant differences between the groups' mean SAT scores.

$$\mu_1 = \mu_2 = \mu_3 = \mu_4 = \mu_5$$

H1 - There is a significant difference between the groups' mean SAT scores.

If there is at least one group with a significant difference with another group, the null hypothesis will be rejected.

```
import pandas as pd
importnumpy as np
importmatplotlib.pyplot as plt
importseaborn as sns
fromscipy import stats

data = pd.read_csv("scores.csv")
data.head()
data['Borough'].value_counts()

############### There is no total score column, have to create it.
########In addition, find the mean score of the each district across all schools.
data['total_score'] = data['Average Score (SAT Reading)'] + \
data['Average Score (SAT Math)']    + \
data['Average Score (SAT Writing)']
```

```
data = data[['Borough', 'total_score']].dropna()
x = ['Brooklyn', 'Bronx', 'Manhattan', 'Queens', 'Staten Island']
district_dict = {}

#Assigns each test score series to a dictionary key
for district in x:
district_dict[district] = data[data['Borough'] == district]['total_score']

y = []
yerror = []
#Assigns the mean score and 95% confidence limit to each district
for district in x:
y.append(district_dict[district].mean())
yerror.append(1.96*district_dict[district].std()/np.sqrt(district_dict[district].shape[0]))
print(district + '_std : {}'.format(district_dict[district].std()))

sns.set(font_scale=1.8)
fig = plt.figure(figsize=(10,5))
ax = sns.barplot(x, y, yerr=yerror)
ax.set_ylabel('Average Total SAT Score')
plt.show()

######################## Perform 1-way ANOVA
print(stats.f_oneway(
district_dict['Brooklyn'], district_dict['Bronx'], \
district_dict['Manhattan'], district_dict['Queens'], \
district_dict['Staten Island']
))

districts = ['Brooklyn', 'Bronx', 'Manhattan', 'Queens', 'Staten Island']

ss_b = 0
for d in districts:
ss_b += district_dict[d].shape[0] * \
np.sum((district_dict[d].mean() - data['total_score'].mean())**2)

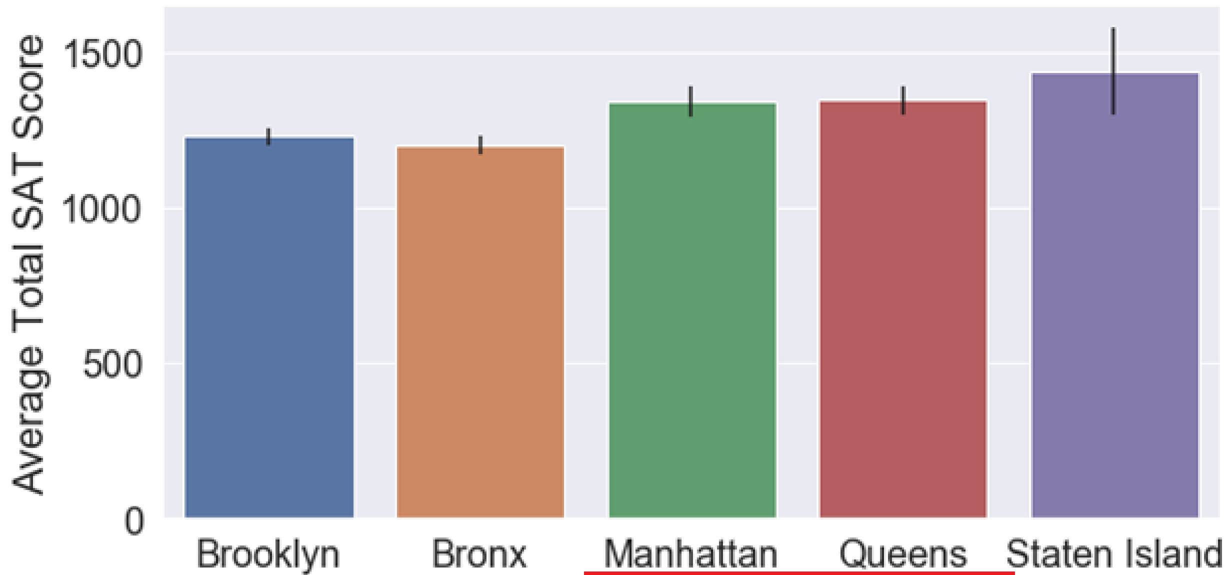
ss_w = 0
for d in districts:
ss_w += np.sum((district_dict[d] - district_dict[d].mean())**2)
```

```
msb = ss_b/4
msw = ss_w/(len(data)-5)
f=msb/msw
print('F_statistic: {}'.format(f))

ss_t = np.sum((data['total_score']-data['total_score'].mean())**2)
eta_squared = ss_b/ss_t
print('eta_squared: {}'.format(eta_squared))
```

Output:

```
In [37]: runfile('E:/Research In Computing/Programs/Practical_05/Annova.py', wdir='E:/Research In Computing/Programs/Practical_05')
Brooklyn_std : 154.8684270520867
Bronx_std : 150.39390071890668
Manhattan_std : 230.2941395363782
Queens_std : 195.25289850192115
Staten Island_std : 222.30359621222706
```



```
F_onewayResult(statistic=12.733085029201668, pvalue=1.0161974965566023e-09)
F_statistic: 12.733085029201687
eta_squared: 0.12099887621529214
```

Since theresulting pvalueis less than 0.05. The null hypothesis is rejected and conclude that there is a significant difference between the SAT scores for each district.

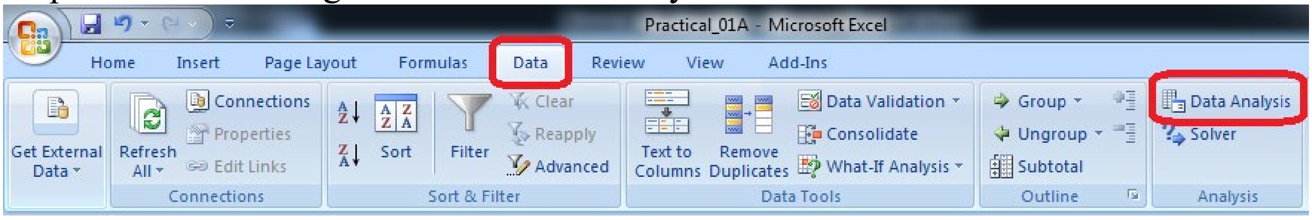
Using Excel

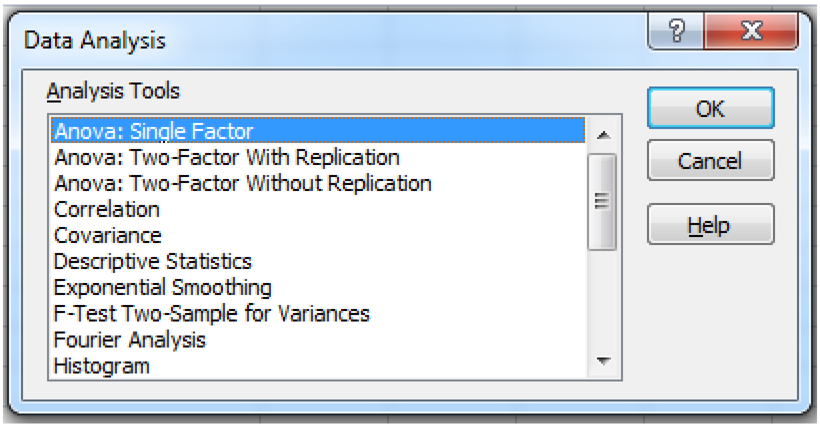
H0 - There are no significant differences between the Subject's mean SAT scores.

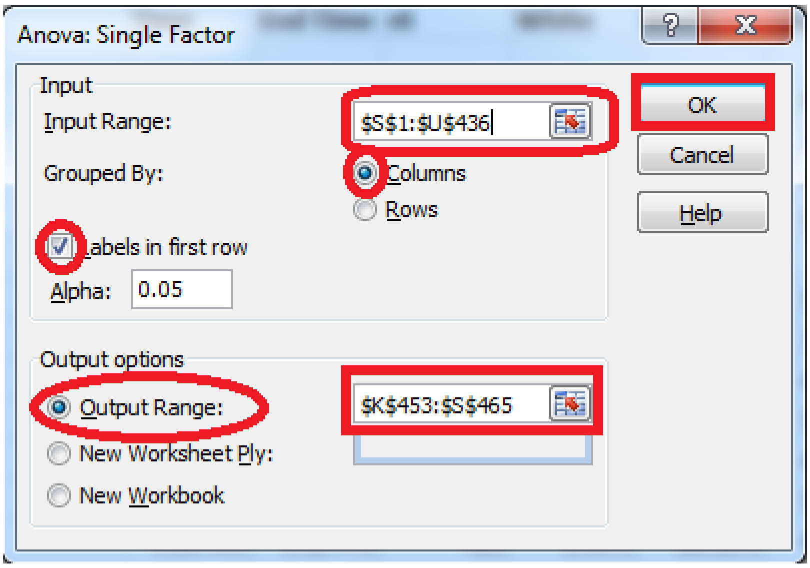
$$\mu_1 = \mu_2 = \mu_3 = \mu_4 = \mu_5$$

H1 - There is a significant difference between the Subject's mean SAT scores.

To perform ANOVA go to data →Data Analysis







Input Range : $S$1:$U$436*(Select columns to be analyzed in group)*

Output Range :$K$453:$S$465*(Can be any Range)*

Anova: Single Factor						
SUMMARY						
Groups	*Count*	*Sum*	*Average*	*Variance*		
Average Score (SAT Math)	375	162354	432.944	5177.144		
Average Score (SAT Reading)	375	159189	424.504	3829.267		
Average Score (SAT Writing)	375	156922	418.4587	4166.522

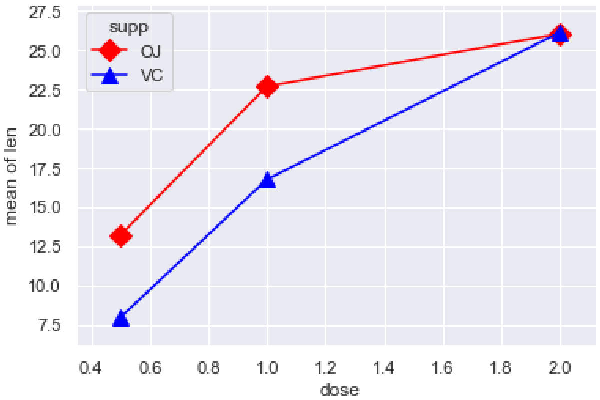
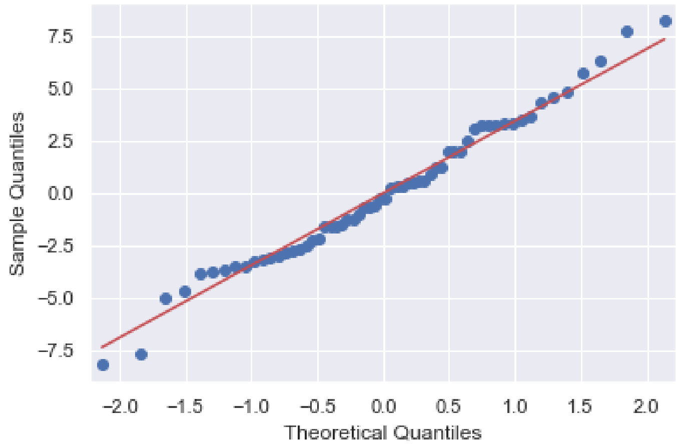
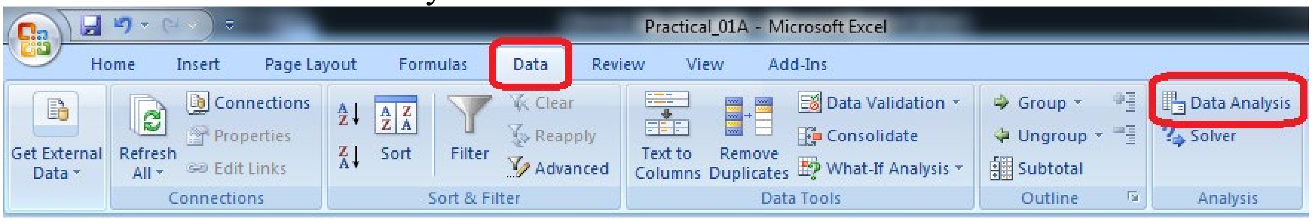
Residual           712.1060  54.0     NaN     NaN     NaN       NaN
```

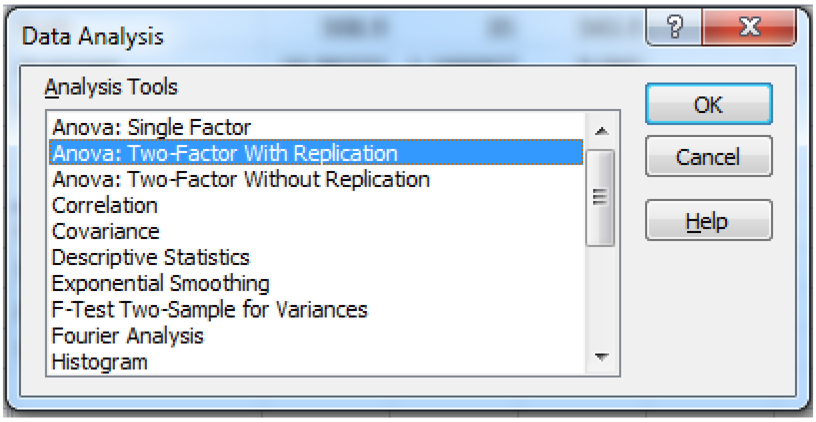


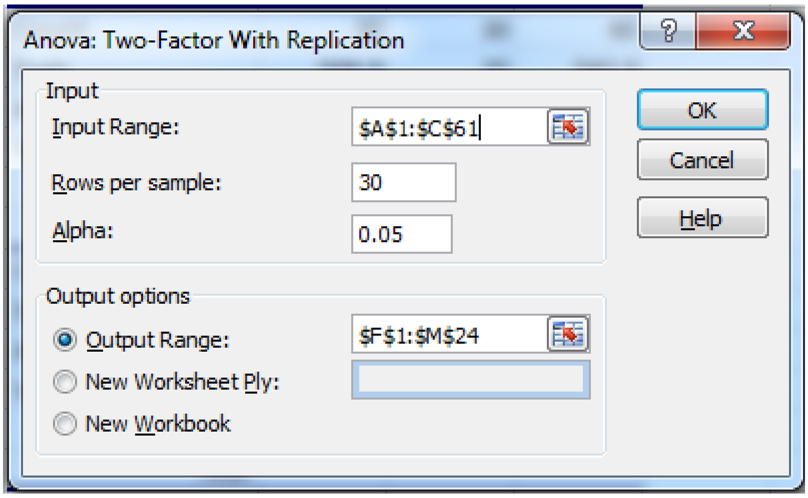


Using Excel:

Go to Data tab → Data Analysis







Input Range - $A$1:$C$61

Rows Per Sample – 30 (Beacause 30 Patients are given each dose)
Alpha – 0.05
Output Range - $F$1:$M$24

Output:

Anova: Two-Factor With Replication						
SUMMARY	len	dose	Total			
1						
Count	30	30	60			
Sum	508.9	35	543.9			
Average	16.96333	1.166667	9.065			
Variance	68.32723	0.402299	97.22333			
31						
Count	30	30	60			
Sum	619.9	35	654.9			
Average	20.66333	1.166667	10.915			
Variance	43.63344	0.402299	118.2854			
Total						
Count	60	60				
Sum	1128.8	70				
Average	18.81333	1.166667				
Variance	58.51202	0.39548				
ANOVA						
Source of Variation	*SS*	*df*	*MS*	*F*	*P-value*	*F crit*
Sample	102.675	1	102.675	3.642079	0.058808	3.922879
Columns	9342.145	1	9342.145	331.3838	8.55E-36	3.922879
Interaction	102.675	1	102.675	3.642079	0.058808	3.922879
Within	3270.193	116	28.19132			
Total	12817.69	119				

P-value = 0.0588079 column in the ANOVA Source of Variation table at the bottom of the output. Because the p-values for both medicin dose and interaction are less than our significance level, these factors are statistically significant. On the other hand, the interaction effect is not significant because its p-value (0.0588) is greater than our significance level. Because the interaction effect is not significant, we can focus on only the main effects and not consider the interaction effect of the dose.

C.Perform testing of hypothesis using MANOVA.

MANOVA is the acronym for Multivariate Analysis of Variance. When analyzing data, we may encounter situations where we have there multiple response variables (dependent variables). In MANOVA there also some assumptions, like ANOVA. Before performing MANOVA we have to check the following assumptions are satisfied or not.

- The samples, while drawing, should be independent of each other.
- The dependent variables are continuous in nature and the independent variables are categorical.
- The dependent variables should follow a multivariate normal distribution.
- The population variance-covariance matrices of each group are same, i.e. groups are homogeneous.

Code:

```
import pandas as pd
fromstatsmodels.multivariate.manova import MANOVA
df = pd.read_csv('iris.csv', index_col=0)
df.columns = df.columns.str.replace(".", "_")
df.head()
print('~~~~~~~~ Data Set ~~~~~~~~')
print(df)
maov = MANOVA.from_formula('Sepal_Length + Sepal_Width + \
Petal_Length + Petal_Width  ~ Species', data=df)
print('~~~~~~~~ MANOVA Test Result ~~~~~~~~')
print(maov.mv_test())
```

Output:

```
In [42]: runfile('E:/Research In Computing/Programs/Practical_10/Manova_Test.py', wdir='E:/Research
In Computing/Programs/Practical_10')
~~~~~~~~ Data Set ~~~~~~~~
     Sepal_Length  Sepal_Width  Petal_Length  Petal_Width    Species

Practical 7:

A. Perform the Random sampling for the given data and analyse it.

Example 1: From a population of 10 women and 10 men as given in the table in Figure 1 on the left below, create a random sample of 6 people for Group 1 and a periodic sample consisting of every 3rd woman for Group 2.

You need to run the sampling data analysis tool twice, once to create Group 1 and again to create Group 2. For Group 1 you select all 20 population cells as the Input Range and Random as the Sampling Method with 6 for the Random Number of Samples. For Group 2 you select the 10 cells in the Women column as Input Range and Periodic with Period 3.

Open existing excel sheet with population data
Sample Sheet looks as given below:

	A	B	C	D	E	F	G	H	I	J	K
1	**Sr. No**	**Roll No**	**Student's Name**	**Gender**	**Grade**		**Sr. No**	**Roll No**	**Student's Name**	**Gender**	**Grade**

Set Cell O1 = Male and Cell O2 = Female
To generate a random sample for male students from given population go to Cell O1 and type

=INDEX(E$2:E$62,RANK(B2,B$2:B$62))

Drag teh formula to the desired no of cell to select random sample.

Now, to generate a random sample for female students go to cell P1 and type
=INDEX(K$2:K$40,RANK(H2,H$2:H$40))
Drag teh formula to the desired no of cell to select random sample.

Output:

O	P
Male	Female
A	A
A	A
A	A
B	A
C	B
C	C
D	C
D	C
D	C
D	C
D	D
D	A
D	B
D	B
O	D
O	D
O	D
O	D
O	O
O	O
O	O
O	O
O	A

B. Perform the Stratified sampling for the given data and analyse it.

we are to carry out a **hypothetical** housing quality survey across Lagos state, Nigeria. And we looking at a total of 5000 houses (hypothetically). We don't just go to one local government and select 5000 houses, rather we ensure that the 5000 houses are a representative of the whole 20 local government areas Lagos state is comprised of. This is called stratified sampling. The population is divided into homogenous strata and the right number of instances is sampled from each stratum to guarantee that the test-set (which in this case is the 5000 houses) is a representative of the overall population. If we used random sampling, there would be a significant chance of having bias in the survey results.

Program Code:

```
import pandas as pd
importnumpy as np

importmatplotlib
importmatplotlib.pyplot as plt

plt.rcParams['axes.labelsize'] = 14
plt.rcParams['xtick.labelsize'] = 12
plt.rcParams['ytick.labelsize'] = 12

importseaborn as sns
color = sns.color_palette()
sns.set_style('darkgrid')

importsklearn
fromsklearn.model_selection import train_test_split

housing =pd.read_csv('housing.csv')
print(housing.head())
print(housing.info())

 #creating a heatmap of the attributes in the dataset
```

```
correlation_matrix = housing.corr()
plt.subplots(figsize=(8,6))
sns.heatmap(correlation_matrix, center=0, annot=True, linewidths=.3)

corr =housing.corr()
print(corr['median_house_value'].sort_values(ascending=False))

sns.distplot(housing.median_income)
plt.show()
```

output:

```

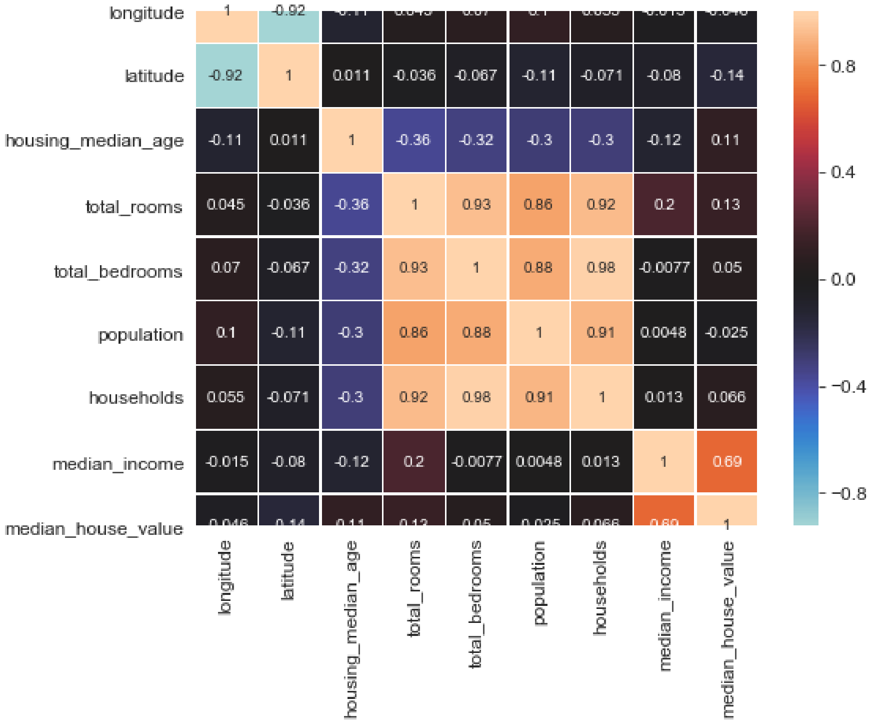
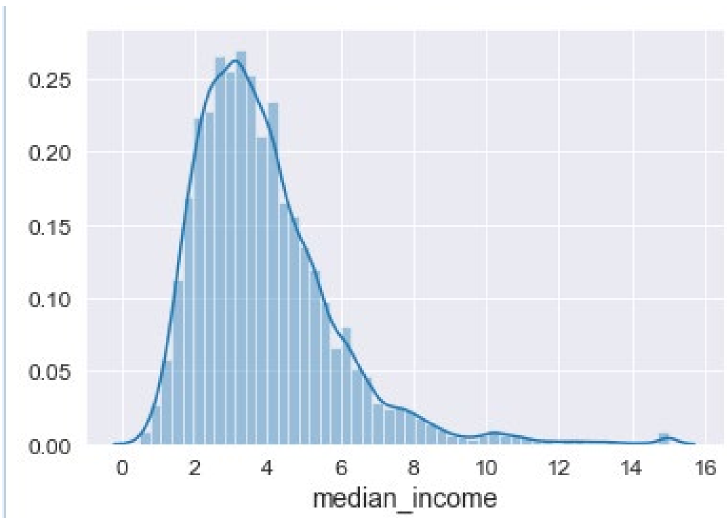
Name: median_house_value, dtype: float64
```



There’s a ton of information we can mine from the heatmap above, a couple of strongly positively correlated features and a couple of negatively correlated features. Take a look at the small bright box right in the middle of the heatmap from total_rooms on the left ’y-axis’ till households and note how bright the box is as well as the highly positively correlated attributes, also note that median_income is the most correlated feature to the target which is median_house_value.



From the image above, we can see that most median incomes are clustered between $20,000 and $50,000 with some outliers going far beyond $60,000 making the distribution skew to the right.

Practical 8:

Write a program for computing different correlation.

Positive Correlation:

Let’s take a look at a positive correlation. Numpy implements a corrcoef() function that returns a matrix of correlations of x with x, x with y, y with x and y with y. We’re interested in the values of correlation of x with y (so position (1, 0) or (0, 1)).

Code:

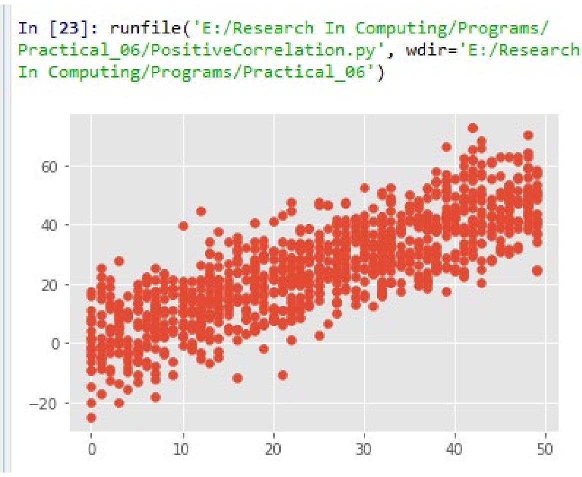
```
importnumpy as np
importmatplotlib.pyplot as plt
np.random.seed(1)
# 1000 random integers between 0 and 50
x = np.random.randint(0, 50, 1000)
# Positive Correlation with some noise
y = x + np.random.normal(0, 10, 1000)

np.corrcoef(x, y)

matplotlib.style.use('ggplot')

plt.scatter(x, y)
plt.show()
```

Output:



Negative Correlation:

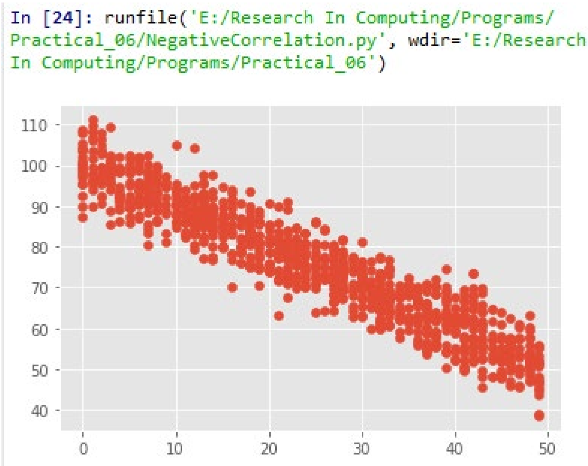
```
importnumpy as np
importmatplotlib.pyplot as plt
np.random.seed(1)
# 1000 random integers between 0 and 50
```

```
x = np.random.randint(0, 50, 1000)

# Negative Correlation with some noise
y = 100 - x + np.random.normal(0, 5, 1000)

np.corrcoef(x, y)
plt.scatter(x, y)
plt.show()
```

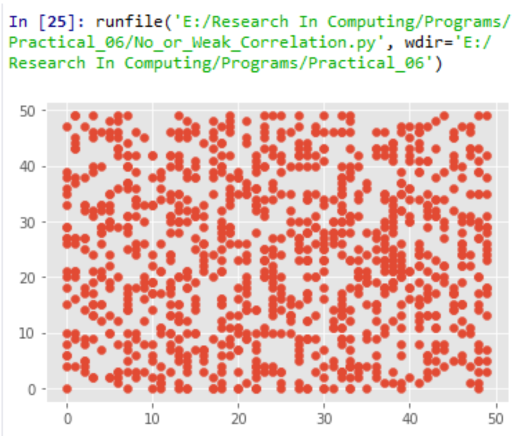
Output:



No/Weak Correlation:

```
importnumpy as np
importmatplotlib.pyplot as plt
np.random.seed(1)
x = np.random.randint(0, 50, 1000)
y = np.random.randint(0, 50, 1000)
np.corrcoef(x, y)
plt.scatter(x, y)
plt.show()
```

Output:



Practical 9:

A.Write a program to Perform linear regression for prediction.

Output:

B. Perform logistic regression analysis.

Logistic regression is a classification method built on the same concept as linear regression. With linear regression, we take linear combination of explanatory variables plus an intercept term to arrive at a prediction.

In this example we will use a logistic regression model to predict survival.

Program Code:

```
import os
import numpy as np
import pandas as pd
import matplotlib
import matplotlib.pyplot as plt
import scipy.stats as stats
from sklearn import linear_model
from sklearn import preprocessing
from sklearn import metrics

matplotlib.style.use('ggplot')
plt.figure(figsize=(9,9))

def sigmoid(t):                    # Define the sigmoid function
    return (1/(1 + np.e**(-t)))

plot_range = np.arange(-6, 6, 0.1)

y_values = sigmoid(plot_range)

# Plot curve
plt.plot(plot_range,   # X-axis range
         y_values,          # Predicted values
         color="red")
titanic_train = pd.read_csv("titanic_train.csv")    # Read the data
char_cabin = titanic_train["Cabin"].astype(str)     # Convert cabin to str
new_Cabin = np.array([cabin[0] for cabin in char_cabin]) # Take first letter

titanic_train["Cabin"] = pd.Categorical(new_Cabin)  # Save the new cabin var

# Impute median Age for NA Age values
new_age_var = np.where(titanic_train["Age"].isnull(), # Logical check
                       28,                       # Value if check is true
```

```
                    titanic_train["Age"])     # Value if check is false

titanic_test["Cabin"] = pd.Categorical(new_Cabin)  # Save the new cabin var

# Impute median Age for NA Age values
new_age_var = np.where(titanic_test["Age"].isnull(), # Logical check
                       28,                       # Value if check is true
                       titanic_test["Age"])      # Value if check is false
```

```
titanic_test["Age"] = new_age_var

# Convert test variables to match model features
encoded_sex = label_encoder.fit_transform(titanic_test["Sex"])
encoded_class = label_encoder.fit_transform(titanic_test["Pclass"])
encoded_cabin = label_encoder.fit_transform(titanic_test["Cabin"])

test_features = pd.DataFrame([encoded_class,
                    encoded_cabin,encoded_sex,titanic_test["Age"]]).T

# Make test set predictions
test_preds = log_model.predict(X=test_features)

# Create a submission for Kaggle
submission = pd.DataFrame({"PassengerId":titanic_test["PassengerId"],
                    "Survived":test_preds})

# Save submission to CSV
submission.to_csv("tutorial_logreg_submission.csv",
            index=False)        # Do not save index values

print(pd)
```

Output:

Survival_prob	0.193110906347	0.729443792051
Sex		
female	0	312
male	577	0

The table shows that the model predicted a survival chance of roughly 19% for males and 73% for females.

```
             precision    recall  f1-score   support

          0       0.82      0.85      0.83       549
          1       0.74      0.70      0.72       340

avg / total       0.79      0.79      0.79       889
```

For the Titanic competition, accuracy is the scoring metric used to judge the competition, so we don't have to worry too much about other metrics.

Survived	0	1
row_0		
0	467	103
1	82	237

The table above shows the classes our model predicted vs. true values of the Survived variable.

This logistic regression model has an accuracy score of 0.75598 which is actually worse than the accuracy of the simplistic women survive, men die model (0.76555).

Example 2:

The dataset is related to direct marketing campaigns (phone calls) of a Portuguese banking institution. The classification goal is to predict whether the client will subscribe (1/0) to a term deposit (variable y). The dataset provides the bank customers' information. It includes 41,188 records and 21 fields.

Input variables

1. **age** (numeric)
2. **job** : type of job (categorical: "admin", "blue-collar", "entrepreneur", "housemaid", "management", "retired", "self-employed", "services", "student", "technician", "unemployed", "unknown")
3. **marital** : marital status (categorical: "divorced", "married", "single", "unknown")
4. **education** (categorical: "basic.4y", "basic.6y", "basic.9y", "high.school", "illiterate", "professional.course", "university.degree", "unknown")
5. **default:** has credit in default? (categorical: "no", "yes", "unknown")
6. **housing:** has housing loan? (categorical: "no", "yes", "unknown")
7. **loan:** has personal loan? (categorical: "no", "yes", "unknown")
8. **contact:** contact communication type (categorical: "cellular", "telephone")
9. **month:** last contact month of year (categorical: "jan", "feb", "mar", …, "nov", "dec")
10. **day_of_week:** last contact day of the week (categorical: "mon", "tue", "wed", "thu", "fri")
11. **duration:** last contact duration, in seconds (numeric). Important note: this attribute highly affects the output target (e.g., if duration=0 then y='no'). The duration is not known before a call is performed, also, after the end of the call, y is obviously known. Thus, this input should only be included for benchmark purposes and should be discarded if the intention is to have a realistic predictive model

12. **campaign:** number of contacts performed during this campaign and for this client (numeric, includes last contact)
13. **pdays:** number of days that passed by after the client was last contacted from a previous campaign (numeric; 999 means client was not previously contacted)
14. **previous:** number of contacts performed before this campaign and for this client (numeric)
15. **poutcome:** outcome of the previous marketing campaign (categorical: “failure”, “nonexistent”, “success”)
16. **emp.var.rate:** employment variation rate — (numeric)
17. **cons.price.idx:** consumer price index — (numeric)
18. **cons.conf.idx**: consumer confidence index — (numeric)
19. **euribor3m:** euribor 3 month rate — (numeric)
20. **nr.employed:** number of employees — (numeric)

Predict variable (desired target):
y — has the client subscribed a term deposit?
(binary: “1”, means “Yes”, “0” means “No”)

print("percentage of no subscription is", pct_of_no_sub*100)
pct_of_sub = count_sub/(count_no_sub+count_sub)
print("percentage of subscription", pct_of_sub*100)

data.groupby('y').mean()
data.groupby('job').mean()
data.groupby('marital').mean()
data.groupby('education').mean()

########### Purchase Frequency for Job Title
pd.crosstab(data.job,data.y).plot(kind='bar')
plt.title('Purchase Frequency for Job Title')
plt.xlabel('Job')
plt.ylabel('Frequency of Purchase')
plt.savefig('purchase_fre_job')

######################## Marital Status vs Purchase
table=pd.crosstab(data.marital,data.y)
table.div(table.sum(1).astype(float), axis=0).plot(kind='bar', stacked=True)
plt.title('Stacked Bar Chart of Marital Status vs Purchase')
plt.xlabel('Marital Status')
plt.ylabel('Proportion of Customers')
plt.savefig('mariral_vs_pur_stack')

#############      Education vs Purchase
table=pd.crosstab(data.education,data.y)
table.div(table.sum(1).astype(float), axis=0).plot(kind='bar', stacked=True)
plt.title('Stacked Bar Chart of Education vs Purchase')
```

```
plt.xlabel('Education')
plt.ylabel('Proportion of Customers')
plt.savefig('edu_vs_pur_stack')

pd.crosstab(data.day_of_week,data.y).plot(kind='bar')
plt.title('Purchase Frequency for Day of Week')
plt.xlabel('Day of Week')
plt.ylabel('Frequency of Purchase')
plt.savefig('pur_dayofweek_bar')

############# Purchase Frequency for Month
pd.crosstab(data.month,data.y).plot(kind='bar')
plt.title('Purchase Frequency for Month')
plt.xlabel('Month')
plt.ylabel('Frequency of Purchase')
plt.savefig('pur_fre_month_bar')

############ Age Purchase frequency pattern
data.age.hist()
plt.title('Histogram of Age')
plt.xlabel('Age')
plt.ylabel('Frequency')
plt.savefig('hist_age')
```

Output: -

percentage of no subscription is 88.73458288821988
percentage of subscription 11.265417111780131

Our classes are imbalanced, and the ratio of no-subscription to subscription instances is 89:11.

- The average age of customers who bought the term deposit is higher than that of the customers who didn't.
- The pdays (days since the customer was last contacted) is understandably lower for the customers who bought it. The lower the pdays, the better the memory of the last call and hence the better chances of a sale.
- Surprisingly, campaigns (number of contacts or calls made during the current campaign)

	are lower for customers who bought the term deposit.

	The frequency of purchase of the deposit depends a great deal on the job title. Thus, the job title can be a good predictor of the outcome variable.

	The marital status does not seem a strong predictor for the outcome variable.

	Education seems a good predictor of the outcome variable.

	Day of week may not be a good predictor of the outcome.

	Month might be a good predictor of the outcome variable.
	Most of the customers of the bank in this dataset are in the age range of 30–40.

Sr. No	Practical No		Name of the Practical	File Names
1)	1	A	Write a program for obtaining descriptive statistics of data.	
2)		B	Import data from different data sources (from Excel, csv, mysql, sql server, oracle to R/Python/Excel)	As required in Data Science Pracitcal
3)	2	A	Design a survey form for a given case study, collect the primary data and analyse it	
4)		B	Perform suitable analysis of given secondary data.
